

Please justify your answers! The most important part is *how* you arrive at an answer, not the answer itself.

**1** Let  $c_f$  denote the space of real-valued sequences with only finitely many non-zero entries. Show that  $c_f$  is dense in  $\ell^p(\mathbb{R})$  for any  $1 \leq p < \infty$ .

**2** a) Illustrate with an example that in Banach's fixed point theorem, completeness of the space is essential and cannot be omitted.

b) It is also essential that  $T$  is a *contraction*; it is not enough that

$$d(Tx, Ty) < d(x, y) \quad \text{when } x \neq y.$$

To see this, consider  $X = [1, \infty) \subset \mathbb{R}$  taken with the usual  $|\cdot|$  norm, and

$$T : X \rightarrow X \quad \text{defined by } x \rightarrow x + \frac{1}{x}.$$

Show that  $|Tx - Ty| < |x - y|$  when  $x \neq y$ , but the mapping has no fixed points.

**3** Problem 1, exam 2007:

Let  $G : C[0, 1] \rightarrow C[0, 1]$  be defined by

$$(Gx)(t) = \int_0^t sx(s) ds, \quad 0 \leq t \leq 1.$$

a) Show that  $G$  is a contraction if  $C[0, 1]$  has the  $\|\cdot\|_\infty$ -norm.

b) Define  $F : C[0, 1] \rightarrow C[0, 1]$  by

$$(Fx)(t) = \frac{t^2}{2} - (Gx)(t), \quad 0 \leq t \leq 1.$$

Show that if  $x_0(t) = 0$  for all  $t$ , then

$$(F^n x_0)(t) = \sum_{k=1}^n (-1)^{k+1} \frac{t^{2k}}{2^k k!}, \quad n = 1, 2, \dots$$

*Hint: Induction.*

c) Explain why  $F$  has a unique fixed point  $x^*$ , and find  $x^*$  by iteration.

**4** Consider the integral equation

$$f(x) = \sin x + \lambda \int_0^3 e^{-(x-y)} f(y) dy$$

for some scalar  $\lambda$ .

- a) Determine for which  $\lambda$  there exists a continuous function  $f$  on  $[0, 3]$  that solves this integral equation.
- b) Pick one of the values of  $\lambda$  found in a). Use the method of iteration, as described in Banach's fixed point theorem, to find approximations  $f_1$  and  $f_2$  to a potential solution by starting with  $f_0(x) = 1$  on  $[0, 3]$ .

**5** Apply Picard iteration to

$$x'(t) = 1 + x^2, \quad x(0) = 0.$$

Find  $x_3$  and the exact solution (notice that the equation is separable), and show that the terms involving  $t, t^2, \dots, t^5$  in  $x_3(t)$  are the same as those of the Taylor series of the exact solution.
